

SUMATRA SIDIKALANG WP DECAF

Sidikalang is a city and district immediately to the west of Lake Toba, the massive crater lake in North Sumatra. While it is near Lintong, Dolok Sanggul and other growing areas, sidikalang coffees have a different flavor profile, more like a classic Mandheling. Part of this is due to micro-climates and influences from the lake, part is due to the cultivar. Sidikalang is in the Dairi district, and the altitude for coffee ranges from 1200 to 1500 meters in altitude. The area has it's own special long bean type, a form of Typica. Sidikalang is found less and less frequently in Sumatra and other parts of Indonesia.. Much of the Typica was lost in the late 1880's, when Coffee Leaf Rust swept through Indonesia. However, both the Bergendal and Sidikalang varieties of Typica can still be found, especially at higher altitudes and in remote areas. The area around sidikalang is still partly planted in it's eponymous cultivar, as well as the newer Ateng type.

SPICE, SCENTED WOOD, WALNUT

Processing: Wet-hulled

Varietal(s): Ateng, Sidikalang
